Experience

FEBRUARY 2025 – MARCH 2026

Edge10 Group

AI-Native Full-Stack Engineer

Delivers production features, migrations and defect fixes on a live NHL athlete management platform entirely through AI-directed development, with no manually written code since February 2025. Designed and deployed three agentic systems into the team's workflow: an API validation agent that audits new .NET endpoints against coding standards and authorisation policies before they ship, a frontend validation agent that checks React changes on every pull request, and an end-to-end testing agent that runs once a change is complete, reducing manual QA effort across the team. Integrated MCP servers into everyday development to extend the toolchain for multi-step work.

NOVEMBER 2022 – JANUARY 2025

Edge10 Group

Full Stack Developer

Owned features end to end on the same platform: C# .NET APIs on a CQRS architecture with authorisation policies and command and query handlers, SQL Server schema design, stored procedures and access-control policies over sensitive athlete health and performance data, and React interfaces for practitioners and coaches. Led legacy-to-modern migrations independently, preserving data integrity and feature parity. Re-architected one feature's data layer from LINQ to native stored procedures, taking its load time from minutes to under a second.

AUGUST 2022 – NOVEMBER 2022

Bombardier

Full Stack Engineer

Built and maintained internal enterprise applications supporting production and progress tracking for business-jet interior components, used across departments through role-based access. Worked across the stack — C#, ASP.NET MVC, .NET Framework and .NET Core, SQL Server, React — implementing frontend and backend features and resolving defects inside an established enterprise environment.

MARCH 2021 – AUGUST 2022

MBC Managed IT Services

Full Stack Developer

Delivered enterprise web applications for external clients in the real estate and manufacturing sectors. Built and consumed REST APIs in C# across ASP.NET MVC, .NET Framework and .NET Core, implemented business features against SQL Server, produced reporting through Crystal Reports, and worked in both React and Angular front ends across concurrent client projects.

JANUARY 2018 – NOVEMBER 2019

Infinity Network Solutions

Full Stack Developer

Developed and maintained modules of an ERP system used by client businesses, working across backend and frontend: REST APIs, SQL Server, Crystal Reports output, and React and Angular interfaces, alongside production issue resolution. When a teammate became unavailable shortly before a committed release with a feature still incomplete, took over the remaining work and saw it through testing so the release shipped on schedule.

Engineering projects

AI INFRASTRUCTURE ENGINEERING

OrchestAI

Multi-tenant agent orchestration service exposed over HTTP, where the guarantees are enforced by infrastructure rather than by convention. Tenant isolation fails closed through EF Core query filters and a database constraint rather than developer discipline; admission, budget and rate decisions resolve before any model call, so rejected work never partially executes; and every run

emits OpenTelemetry-shaped trace and span identifiers, making an execution reconstructable end to end. Sole engineer — architecture, decision records and verification strategy.

.NET 8 · ASP.NET Core · MediatR · EF Core 8 · PostgreSQL · MCP

AI PRODUCT ENGINEERING

NovaMind AI

Document-intelligence platform built to implement the full retrieval lifecycle directly, without managed retrieval services or a RAG framework in between. Retrieval runs as four inspectable stages — embed, vector search, rerank, cited generation — rather than one opaque call, and every answer carries a citation to the passage supporting it. Vectors live in the same PostgreSQL instance as users and documents, so a document and its embeddings commit together. Sole engineer through deployment; verification stayed manual.

Python 3.11 · FastAPI · pgvector · React 18 · Voyage AI · Claude

ENTERPRISE ENGINEERING

Edge10 platform

Athlete performance and health platform in professional sport. Feature ownership end to end on a CQRS .NET codebase over access-controlled SQL Server data, detailed under Experience above.

C# .NET · CQRS · SQL Server · React

Technologies

BACKEND

C# .NET · CQRS · MediatR · PostgreSQL · SQL Server

FRONTEND

React · TypeScript · Next.js
